1.INTRODUCTION

1.1 PROJECT OVERVIEW

Water is the primary need of all living beings and living without water is impossible. With the advancement of technology and industrialization, environmental pollutions have become a major concern. Water pollution is one of the most serious types of this environmental pollution. Our lives depend on the quality of water that we consume in different ways, from juices which are produced by the industries. Any imbalance in the quality of water would severely affect the humans health and at the same time it would affect the ecological balance among all species. Water quality refers to the chemical, biological, radiological, and biological parameters of the water.

The essential parameters of the water quality vary based on the application of water. For example, for aquariums, it is necessary to maintain the temperature, pH level, dissolved oxygen level, turbidity, and the level of the water in a certain normal range in order to ensure the safety of the fish inside the aquarium. For the industrial and household applications, however, some parameters of the water are more essential to be monitored frequently than the others, depending on the usage of the water.

1.2 PURPOSE

The traditional method for monitoring of the water quality is such that the water sample is taken and sent to the laboratory to be tested manually by analytical methods. Although by this method the chemical, physical, and biological agents of the water can be analyzed, it has several drawbacks. Firstly, it is time consuming and labor intensive. Secondly, the cost for this method was somewhat high.

Compared to the conventional water quality testing techniques, sensor based water quality testing has many advantages such as accurate, high sensitivity, good selectivity, speed, fast response, low cost etc.

2.LITERATURE SURVEY

2.1 EXISTING PROBLEM

Existing system has a mechanisms which are semi-automated or manually controlled devices which are to be handled by a person responsible for monitoring the water quality. There is need to have human intervention in taking various reading of the water parameters.

The instruments or tools are used either by putting/inserting a water sensing part into water and seeing the result on small display device or by directly inserting a portable device in water and watching the output on the display. Central Water Commission (CWC) monitors water quality, by collecting samples from representative locations within the processing and distribution system.

These samples are analyzed at the well-equipped laboratories. At these laboratories, samples of raw water, filter water and treated water are taken for analysis, these analysis can be performed by human intervention which for specific period only. The disadvantage of this system is, water is not monitoring seamlessly, and it always needs a human intervention.

2.2 REFERENCES

J.Navarajan et al.[1]: Paper focuses on Detection on water pollution and water management using smart sensors iotTo ensure the safe supply of drinking water the quality should be monitored in real time for that purpose new approach IOT (Internet of Things) based water quality monitoring has been proposed.This system consists some sensors. Which measure the water quality parameter such as pH, turbidity, conductivity, dissolved oxygen, temperature. The measured values from the sensors are processed by microcontroller and these processed values are transmitted remotely to the core controller that is raspberry pi using Zigbee protocol. Based on a study of existing water quality monitoring system and scenario of water we can say that proposed system is more suitable to monitor water quality parameters in real time. Based on a study of existing water quality monitoring system and scenario of water we can say that proposed system is more suitable to monitor water quality parameters in real time.

NatasaMarkovic et al. [2]: this research paper focuses on Sensor Web for River Water Pollution Monitoring and Alert SystemSensor Web has provided infrastructure for collecting and processing data from distributed and heterogeneous sensors. This set of technologies has found various implementations, especially in the area of environmental monitoring. The Sensor Web architecture for crisis management, described in this paper, provides active monitoring of measuring parameters and timely responses in cases of environmental disasters. The River Water Management and Alert System built on this architecture enable access, control and management of river water pollution.

K.A. UnnikrishnaMenon et al,[3]: This research paper focuses on Wireless Sensor Network for River Water Quality Monitoring in India This paper introduces a river water quality monitoring system based on wireless sensor network which helps in continuous and remote monitoring of the water quality data in India. The wireless

sensor node in the system is designed for monitoring the pH of water, which is one of the main parameters that affect the quality of water. Wireless sensor Network which aids in River Water Quality Monitoring. This paper also proposes a novel technique for the design of a water quality sensor node which can be used for monitoring the pH of water.

Aswinkumar et al.[4]: This research paper focuses on Detection on water pollution and water management using smart sensors. 2.3 PROBLEM STATEMENT DEFINITION

Agriculture is the backbone of Delta region in Tamil nadu. 80% of cultivation depends on Cauvery river water. The river water is carried through the agricultural fields via canals. And the river water is the main source of drinking water supply for the localities. But it was polluted by fertilizers, pesticides, chemicals and also by some biological activities. It directly affects people's health and aquarium lifestyle. So, the quality of water needs to be monitor, that is ulmost important to use it for various purposes.

It is mandatory to monitor pH level and temperature of the river water. If the quality of the water is not good it will be announced to localities not to use the water.

Problem Statement(PS)	I am	I'm trying to	But	Because	Which makes me feel
PS -1	Farmer	Cultivate paddy, sugercane, maize	Not able to harvest good quality of crops	Inadequate Supply of good quality of water	and it also affect cattles
PS -2	General public	Use good quality of water for various purpose	It is not good to drink and use	High usage of pesticides, and sewage mixes with river water	Unhealthy and struggles for daily usage of water

3.IDEATION & PROPOSED SOLUTION

3.1 EMPATHY MAP CANVAS

3.2 IDEATION AND BRAINSTROMING

Step-1: Team Gathering, Collaboration and Select the Problem Statement:

Brainstorm & idea prioritization

Use this template in your own brainstorming sessions so your team can unleash their imagination and start shaping concepts even if you're not sitting in the same room.

10 minutes to prepare
 1 hour to collaborate
 2-8 people recommended

[Share template feedback](#)

Before you collaborate

A little bit of preparation goes a long way with this session. Here's what you need to do to get going.

10 minutes

A Team gathering
Define who should participate in the session and send an invite. Share relevant information or pre-work ahead.

B Set the goal
Think about the problem you'll be focusing on solving in the brainstorming session.

C Learn how to use the facilitation tools
Use the Facilitation Superpowers to run a happy and productive session.

[Open article](#)

1 Define your problem statement

What problem are you trying to solve? Frame your problem as a How Might We statement. This will be the focus of your brainstorm.

5 minutes

PROBLEM

River water is polluted due to various factors, it directly affects people's health and good cultivation of crops.

Key rules of brainstorming

To run an smooth and productive session

- Stay in topic.
- Defer judgment.
- Go for volume.
- Encourage wild ideas.
- Listen to others.
- If possible, be visual.

Need some inspiration?

Here's a featured example that has helped others get started. [Open example](#)

Step-2: Brainstorm, Idea Listing and Grouping:

2 Brainstorm

Write down any ideas that come to mind that address your problem statement.

10 minutes

Swethaa

Gayathri

Ramana Bhavathi

Renuka

Prakash

Tip
You can attach sticky notes to the board for the group. Just click the desired note to start editing.

3 Group ideas

Take turns sharing your ideas while clustering similar or related notes as you go. Once all sticky notes have been grouped, give each cluster a sentence-like label. If a cluster is bigger than six sticky notes, try and see if you can break it up into smaller sub-groups.

20 minutes

Data transfer to cloud without delay

pH sensor and temperature sensor are in good condition

ThingSpeak can accept for the support list

Values of pH hardness can be maintained at desired level

Secure then network connection to get data from the sensor and convert into

Tip
You can create a new group for sticky notes by clicking the plus icon in the top right corner. To delete a group, click the trash icon in the top right corner.

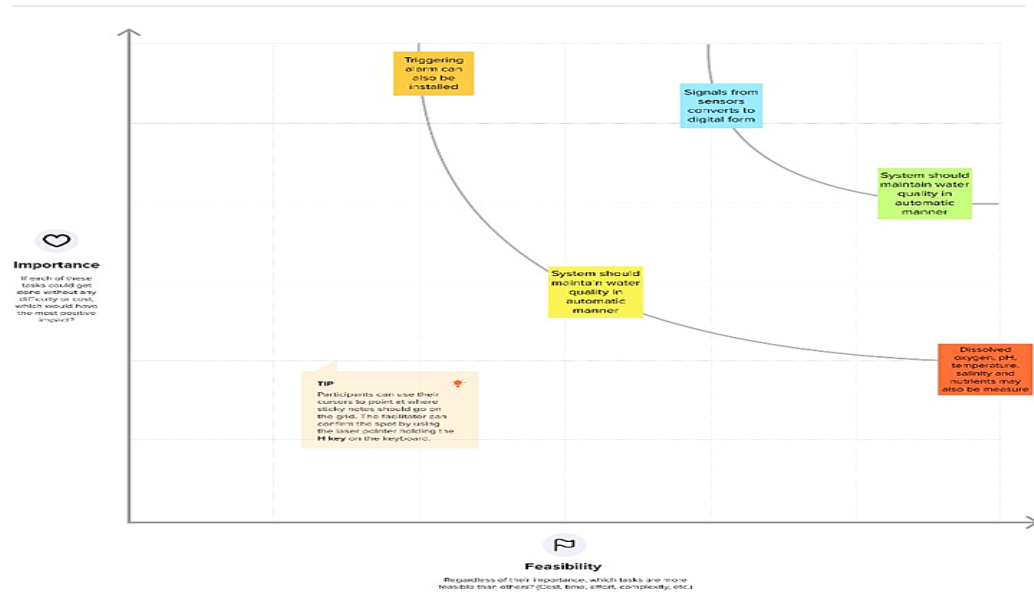

Step-3: Idea Prioritization:

4

Prioritize

Your team should all be on the same page about what's important moving forward. Place your ideas on this grid to determine which ideas are important and which are feasible.

20 minutes

3.3 PROPOSED SOLUTION

S.No	Parameter	Description
1.	Problem Statement (Problem to be solved)	In Delta regions, the river water is the major source and backbone for farmers for cultivating crops and drinking water supply for the localities. But it is polluted by fertilizers, pesticides, chemicals and also by some biological activities. It directly affects people's health and aquarium lifestyle. So, the quality of water needs to be monitored.

2.	Idea / Solution description	Monitoring the quality of river water/water bodies using sensors and arduino for domestic and agriculture purposes.
3.	Novelty / Uniqueness	Measured pH and temperature can be monitored by using mobile app
4.	Social Impact/ Customer Satisfaction	People come to know about the quality of water
5.	Business Model (Revenue Model)	Water Monitoring and Control Model
6.	Scalability of the Solution	The process of operating this Model is user friendly and more suitable for domestic and agricultural purposes

3.4 PROBLEM SOLUTION FIT

Problem-Solution fit canvas 2.0		Purpose / Vision	
Define CS, fit into CC	1. CUSTOMER SEGMENT(S) CS Who is your customer? i.e. working parents of 0-5 y.o. kids Farmers and Localities in Delta region of Tamilnadu.	6. CUSTOMER CONSTRAINTS CC What constraints prevent your customers from taking action or limit their choices of solutions? i.e. spending power, budget, no cash, network connection, available devices. Finding fault in the system and handling sensors	5. AVAILABLE SOLUTIONS AS Which solutions are available to the customers when they face the problem or need to get the job done? What have they tried in the past? What pros & cons do these solutions have? i.e. pen and paper is an alternative to digital notetaking Customers are trained to handle the system and sensors. Suitable training will be provided to handle the system and sensors before deploying the nodes.
	2. JOBS-TO-BE-DONE / PROBLEMS J&P Which jobs-to-be-done (or problems) do you address for your customers? There could be more than one, explore different sides. Periodically river water quality of the river water <u>interms</u> of pH and temperature is monitored and updated using a dedicated mobile app.	9. PROBLEM ROOT CAUSE RC What is the real reason that this problem exists? What is the back story behind the need to do this job? i.e. customers have to do it because of the change in regulations. In Delta region, river water is the main source for cultivation and domestic uses. But the water <u>get</u> polluted by fertilizers, pesticides and other factors. So, the water is not fit for use	7. BEHAVIOUR BE What does your customer do to address the problem and get the job done? i.e. directly related: find the right solar panel installer, calculate usage and benefits; indirectly associated: customers spend free time on volunteering work (i.e. Greenpeace) Directly, farmers and localities are <u>grouped</u> as a team and get trained by the <u>expert</u> with the technology deployed at the best points of river bodies. Indirectly, <u>helplines</u> will be provided, and at the worst case, availability of the expert / <u>technical</u> persons are made in order to support the farmers and localities
Focus on J&P, tap into BE, understand RC		Explore AS, differentiate	

Identify strong TR & EM	3. TRIGGERS TR What triggers customers to act? i.e. seeing their customers installing solar panels, reading about a more efficient solution in the news. People using this system will feel free from water borne disease so it will make others to use it	10. YOUR SOLUTION SL If you are working on an existing business, write down your current solution first. Fill in the canvas, and check how much it fits reality. If you are working on a new business proposition, then keep it blank until you fill in the canvas and come up with a solution that fits within customer limitations, solves a problem and matches customer to River water quality is checked periodically using sensors. If the quality is not good to drink or use for other purposes system will alert the Localities	8. CHANNELS of BEHAVIOUR CH 1. ONLINE In online mode customer can contact us via email 2. OFFLINE What kind of actions do customers take offline? Extract offline channels from it? and use them for customer development. In offline mode customer can contact us via helpline number
	4. EMOTIONS: BEFORE / AFTER EM Before people feel unhealthy and not able to produce crops in profitable manner. After installing this system they will feel good and produce quality crops		

4.REQUIREMENT ANALYSIS

4.1 FUNCTIONAL REQUIREMENT

FR No.	Functional Requirement	Sub Requirement(Story/Sub-Task)
FR-1	User Login	Confirmation through verified password
FR-2	View Water Details	View current water detail sin website View traditional water eligibility in website
FR-3	Logout	Logs out the user successfully

4.2 NON FUNCTIONAL REQUIREMENT

FR No.	Non-Functional Requirement	Description
NFR-1	Usability	Load time for user interface screens shall not be more than 2 seconds.
NFR-2	Security	User account is password protected Account creation done only after email verification
NFR-3	Reliability	Users can access their account 98% of the time without failure
NFR-4	Performance	Load time for user interface screens shall not be more than 2 seconds. Login info verified within 10 seconds.
NFR-5	Availability	Maximum down time will be about 4 hours
NFR-6	Scalability	System can handle about 1000 users at any given time

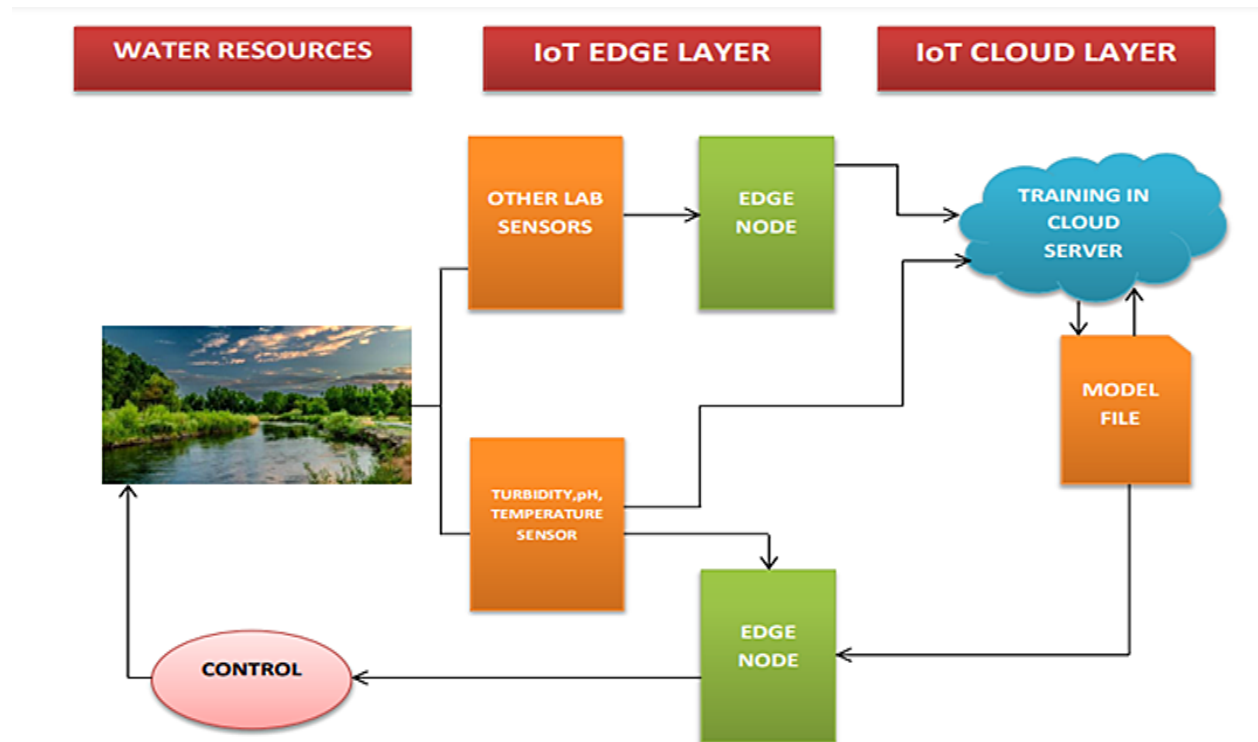

5.PROJECT DESIGN

5.1 DATA FLOW DIAGRAMS

8.TESTING

8.1 TEST CASES

This report shows the number of test cases that have passed, failed, and untested.

Section	TotalCases	Not Tested	Fai l	Pass
Print Engine	15	0	0	15
Client Application	45	0	0	45
Security	1	0	0	1
Outsource Shipping	2	0	0	2
Exception Reporting	10	0	0	10
Final ReportOutput	4	0	0	4

Version Control	3	0	0	3
-----------------	---	---	---	---

8.2 USER ACCEPTANCE TESTING

1.PURPOSE OF DOCUMENT

The purpose of this document is to briefly explain the test coverage and open issues of the REAL TIME RIVER WATER QUALITY MONITORING AND CONTROL SYSTEMS project at the time of the release to User Acceptance Testing (UAT).

2.DEFECT ANALYSIS

This report shows the number of resolved or closed bugs at each severity level, and how they were resolved

9.RESULTS

9.1 PERFORMANCE METRICS

PARAMETER	PERFORMANCE	DESCRIPTION
ADMIN TESTING	95%-100%	THE TESTING DONE BEFORE IT IS DEPLOYED AS AN APP
CUSTOMER SATISFACTION	75-85%	THE CUSTOMER NEED TO BE SATISFIED WITH THE MOBILE APPLICATION

USER INTERFACE	65-85%	THE APP CAN USED BY ANYONE.(EASE OF ACCESS)
-------------------	--------	---

10.ADVANTAGES & DISADVANTAGES

ADVANTAGES

- User friendly
- Data accuracy
- Reliability
- Efficiency

DISADVANTAGES

- High cost for smart sensors

11.CONCLUSION

The prototype developed for water quality maintenance is very beneficial for safeguarding public health and also adds to the clean environment. The automation of this water monitoring, cleaning and control process removes the need of manual labor and thus saves time and money. The automation of the system makes the control and monitoring process more efficient and effective.

12.FUTURE SCOPE

Expanding and ability to connect the different buildings in the city to one network and continuously monitor the water quality and consumption

in different area, in different area, in addition, investigate the causes that changes water quality and adjust them immediately.
